HW05

Exercise 7.2.5

Exercise 7.2.7

Exercise 7.2.8

## Problem 1

**Exercise 7.2.5** Let  $\gamma = \sqrt{2 + \sqrt{2}}$ .

1. Show that  $\mathbb{Q}(\gamma) : \mathbb{Q}$  is normal with cyclic Galois Group.

2. Show that  $\mathbb{Q}(\gamma, i) = \mathbb{Q}(\phi)$  with  $\phi^4 = i$ .

**Soln:**

**Part A**

Let

$$\sqrt{2 + \sqrt{2}} = X \quad (1)$$

$$\sqrt{2} = X^2 - 2 \quad (2)$$

$$2 = (X^2 - 2)^2 = X^4 - 4X^2 + 4 \quad (3)$$

Thus,  $\sqrt{2 + \sqrt{2}}$  is a root of  $X^4 - 4X^2 + 2 =: f$ . Since  $f$  is irreducible, by Eisenstein ( $p = 2$ ),  $\mathbb{Q}(\gamma)$  is degree 4 over  $\mathbb{Q}$ , we could find the roots of  $f$ :

$$f = \left(X + \sqrt{2 + \sqrt{2}}\right) \left(X - \sqrt{2 + \sqrt{2}}\right) \left(X + \sqrt{2 - \sqrt{2}}\right) \left(X - \sqrt{2 - \sqrt{2}}\right) \quad (4)$$

Let  $\phi \in \Gamma(\mathbb{Q}(\gamma) : \mathbb{Q})$ , we know  $\phi$  permutes the roots of  $f$ .

If we can find an element  $\phi$  with order strictly greater than 2, then since order of the element need to divide the order of the group,  $|\phi|$  must be 4. Since up to isomorphism, group of order 4 is  $\mathbb{Z}_4$  and  $\mathbb{Z}_2 \oplus \mathbb{Z}_2$ , we know once there exists  $|\phi| = 4$ ,  $\Gamma(\mathbb{Q}(\gamma) : \mathbb{Q})$  must be cyclic.

First, we show  $\mathbb{Q}(\gamma)$  is splitting field of  $f$  that has no multiple roots, which would imply it is normal. since

$$\sqrt{2 + \sqrt{2}} = \gamma \in \mathbb{Q}(\gamma) \implies -\sqrt{2 + \sqrt{2}} \in \mathbb{Q}(\gamma) \quad (5)$$

$$2 + \sqrt{2} = \gamma^2 \in \mathbb{Q}(\gamma) \quad (6)$$

so  $\sqrt{2} \in \mathbb{Q}(\gamma)$ . Since

$$\sqrt{2 + \sqrt{2}} \cdot \sqrt{2 - \sqrt{2}} = \sqrt{2} \in \mathbb{Q}(\gamma) \implies \sqrt{2 - \sqrt{2}} \in \mathbb{Q}(\gamma) \quad (7)$$

so  $-\sqrt{2 - \sqrt{2}} \in \mathbb{Q}(\gamma)$ .

Thus, all 4 roots of  $f$  are in  $\mathbb{Q}(\gamma)$ . And these roots are all distinct. so

$$\mathbb{Q} \left( \sqrt{2 + \sqrt{2}}, -\sqrt{2 + \sqrt{2}}, \sqrt{2 - \sqrt{2}}, -\sqrt{2 - \sqrt{2}} \right) \subseteq \mathbb{Q}(\gamma) \quad (8)$$

$$\mathbb{Q} \left( \sqrt{2 + \sqrt{2}}, -\sqrt{2 + \sqrt{2}}, \sqrt{2 - \sqrt{2}}, -\sqrt{2 - \sqrt{2}} \right) \supseteq \mathbb{Q}(\gamma) \quad (9)$$

$$\text{so } \mathbb{Q} \left( \sqrt{2 + \sqrt{2}}, -\sqrt{2 + \sqrt{2}}, \sqrt{2 - \sqrt{2}}, -\sqrt{2 - \sqrt{2}} \right) = \mathbb{Q}(\gamma) \quad (10)$$

$$(11)$$

Thus,  $\mathbb{Q}(\gamma)$  is indeed splitting field of  $f$  with no multiple roots, so  $\mathbb{Q}(\gamma) : \mathbb{Q}$  is Galois extension, and is normal extension. Now we find  $\phi \in \Gamma(\mathbb{Q}(\gamma) : \mathbb{Q})$  that has order  $\geq 3$ . Claim:

$$\sqrt{2 + \sqrt{2}} \mapsto_{\phi} \sqrt{2 - \sqrt{2}} \quad (12)$$

does the job.

*Why does such an automorphism exist? Answer: Galois group acts transitively on the roots of a minimal polynomial*

Let

$$X_1 = -\sqrt{2 + \sqrt{2}}, \quad X_2 = \sqrt{2 + \sqrt{2}}, \quad X_3 = -\sqrt{2 - \sqrt{2}}, \quad X_4 = \sqrt{2 - \sqrt{2}} \quad (13)$$

Hence

$$\phi \circ \phi \left( \sqrt{2 + \sqrt{2}} \right) = \phi \left( \sqrt{2 - \sqrt{2}} \right) \quad (14)$$

$$= \phi \left( \frac{\sqrt{2}}{\sqrt{2 + \sqrt{2}}} \right) \quad (15)$$

$$= \frac{\phi(\sqrt{2})}{\phi(\sqrt{2 + \sqrt{2}})} \quad (16)$$

$$= \frac{-\sqrt{2}}{\sqrt{2 - \sqrt{2}}} \quad (17)$$

$$= -\sqrt{2 + \sqrt{2}} \quad (18)$$

We also have

$$\phi(2) + \phi(\sqrt{2}) = \phi(2 + \sqrt{2}) \quad (19)$$

$$= \phi \left( \sqrt{2 + \sqrt{2}} \cdot \sqrt{2 + \sqrt{2}} \right) \quad (20)$$

$$= \phi \left( \sqrt{2 + \sqrt{2}} \right) \cdot \phi \left( \sqrt{2 + \sqrt{2}} \right) \quad (21)$$

$$= \left( \sqrt{2 - \sqrt{2}} \right) \cdot \left( \sqrt{2 - \sqrt{2}} \right) \quad (22)$$

$$= 2 - \sqrt{2} \quad (23)$$

so  $\phi(2) + \phi(\sqrt{2}) = 2 - \sqrt{2}$ , since  $\phi(2) = 2$  implies  $\phi(\sqrt{2}) = -\sqrt{2}$ .

Since  $\phi^2$  is not identity automorphism,  $|\phi| \geq 3$ , and we found the desired  $\phi$ .

We can check  $\phi$  indeed permutes  $X_1, X_2, X_3, X_4$ .

$$X_2 \xrightarrow{\phi} X_4 \quad (24)$$

$$\phi(X_1) = \phi(-\sqrt{2 + \sqrt{2}}) = -\sqrt{2 - \sqrt{2}} = X_3 \quad (25)$$

$$\phi(X_3) = \phi(-\sqrt{2 - \sqrt{2}}) = (-1) \cdot (-\sqrt{2 + \sqrt{2}}) = \sqrt{2 + \sqrt{2}} = X_2 \quad (26)$$

$$\phi(X_4) = -\sqrt{2 + \sqrt{2}} = X_1 \quad (27)$$

$$\phi : X_1 \rightarrow X_3 \rightarrow X_2 \rightarrow X_4 \rightarrow X_1 \quad (28)$$

## Part B

Show  $\mathbb{Q}(\gamma, i) = \mathbb{Q}(\phi)$  with  $\phi^4 = i$ .

Use formula

$$\cos(A) = 1 - 2 \sin^2 \frac{A}{2} \quad (29)$$

$$1 - 2 \sin^2(22.5^\circ) = \cos 45^\circ \quad (30)$$

$$\sin^2(22.5^\circ) = \frac{\sqrt{2} - 1}{2\sqrt{2}} \quad (31)$$

$$\sin^2(22.5^\circ) = \frac{\sqrt{2 - \sqrt{2}}}{2} \quad (32)$$

And also,

$$\cos(A) = 2 \cos^2 \frac{A}{2} - 1 \quad (33)$$

$$\cos 45^\circ = 2 \cos^2 22.5^\circ - 1 \quad (34)$$

$$\frac{1}{\sqrt{2}} + 1 = 2 \cos^2(22.5^\circ) \quad (35)$$

$$\sqrt{\frac{1 + \sqrt{2}}{2\sqrt{2}}} = \cos(22.5^\circ) \quad (36)$$

$$\cos(22.5^\circ) = \frac{\sqrt{\sqrt{2} + 2}}{2} \quad (37)$$

Since

$$\phi = \frac{\sqrt{\sqrt{2} + 2}}{2} + \frac{\sqrt{2 - \sqrt{2}}}{2}i \in \mathbb{Q}(\phi) \quad (38)$$

WTS  $\phi \in \mathbb{Q}(\gamma, i)$ .

$$i \in \mathbb{Q}(\gamma, i), \sqrt{\sqrt{2} + 2} = \gamma \in \mathbb{Q}(\gamma, i) \quad (39)$$

$$\sqrt{2} + 2 = \gamma^2 \in \mathbb{Q}(\gamma, i) \implies \sqrt{2} \in \mathbb{Q}(\gamma, i) \quad (40)$$

Thus, since

$$\sqrt{\sqrt{2} + 2} \cdot \sqrt{2 - \sqrt{2}} = \sqrt{2} \implies \sqrt{2 - \sqrt{2}} \in \mathbb{Q}(\gamma, i) \quad (41)$$

so  $\phi \in \mathbb{Q}(\gamma, i)$  as wanted.

so  $\mathbb{Q}(\phi) \subseteq \mathbb{Q}(\gamma, i)$ . Now, we show  $\mathbb{Q}(\phi)$  and  $\mathbb{Q}(\gamma, i)$  has same degree over  $\mathbb{Q}$ , which implies they are equal.

$$[\mathbb{Q}(\phi) : \mathbb{Q}] = 8, \quad (42)$$

since  $\varphi(16) = 8$ , there are 8 numbers less than 16 that coprime with 16:

$$1, 3, 5, 7, 9, 11, 13, 15 \quad (43)$$

$$[\mathbb{Q}(\gamma, i) : \mathbb{Q}] = 8 \quad (44)$$

## Problem 2

**Exercise 7.2.7** Find the degree of

$$\sqrt[5]{81} + 29\sqrt[5]{9} + 17\sqrt[5]{3} - 16 \quad (45)$$

over  $\mathbb{Q}$ .

**Soln:**

Observe that if we adjoint  $\sqrt[5]{3}$  to  $\mathbb{Q}$ , then

$$\gamma := (\sqrt[5]{3})^4 + 29(\sqrt[5]{3})^2 + 17\sqrt[5]{3} - 16 \in \mathbb{Q}(\sqrt[5]{3}). \quad (46)$$

since  $\sqrt[5]{3}$  is root of  $X^5 - 3$ , which is irreducible by Eisenstein.

$$m_{\mathbb{Q}}(\sqrt[5]{3}) = X^5 - 3 \quad (47)$$

and  $\mathbb{Q}(\sqrt[5]{3})$  is degree 5 extension.

Since  $\gamma \in \mathbb{Q}(\sqrt[5]{3})$ , we have  $[\mathbb{Q}(\gamma) : \mathbb{Q}]$  divides  $[\mathbb{Q}(\sqrt[5]{3} : \mathbb{Q})] = 5$  so  $\mathbb{Q}(\gamma)$  is either degree 1 or 5.

If it's degree 1, then  $\gamma \in \mathbb{Q}$ , so there exists  $q \in \mathbb{Q}$  such that  $\gamma = q$ .

$$\left(\sqrt[5]{3}\right)^4 + 29\left(\sqrt[5]{3}\right)^2 + 17\sqrt[5]{3} - 16 - q = 0 \quad (48)$$

Thus,  $\sqrt[5]{3}$  is a root of the above polynomial with coefficients in  $\mathbb{Q}$ , but this polynomial is degree 4, contradicting the minimal polynomial of  $\sqrt[5]{3}$  having degree 5. Thus,  $\mathbb{Q}(\gamma)$  is degree 5. so the degree of  $\gamma$  over  $\mathbb{Q}$  is 5.

### Problem 3

**Exercise 7.2.8** Find the degree of  $\sqrt[5]{81}$  over  $\mathbb{Q}(\sqrt[81]{5})$ .

**Soln:**

First we show  $\mathbb{Q}(\sqrt[5]{81}) = \mathbb{Q}(\sqrt[5]{3})$ .

Want to show  $\sqrt[5]{81} \in \mathbb{Q}(\sqrt[5]{3})$ . Write  $\sqrt[5]{81} = (\sqrt[5]{3})^4 \in \mathbb{Q}(\sqrt[5]{3})$ . So  $\mathbb{Q}(\sqrt[5]{81}) \subset \mathbb{Q}(\sqrt[5]{3})$ . Want to show  $\sqrt[5]{3} \in \mathbb{Q}(\sqrt[5]{81})$ : write  $3^{1/5} = (3^{4/5})^4 (3^{-1})^3 \in \mathbb{Q}(\sqrt[5]{81})$  so  $\mathbb{Q}(\sqrt[5]{3}) \subseteq \mathbb{Q}(\sqrt[5]{81})$   
so  $\mathbb{Q}(\sqrt[5]{81}) = \mathbb{Q}(\sqrt[5]{3})$

Since  $X^5 - 3$  is irreducible by Eisenstein,  $\mathbb{Q}(\sqrt[5]{3})$  is degree 5 over  $\mathbb{Q}$ , so  $\mathbb{Q}(\sqrt[5]{81})$  is degree 5 over  $\mathbb{Q}$ .

$\mathbb{Q}(\sqrt[81]{5})$  is degree 81 over  $\mathbb{Q}$ , since  $X^{81} - 5$  is irreducible by Eisenstein.

By earlier exercise

$$[\mathbb{Q}(\sqrt[5]{81}, \sqrt[81]{5}) : \mathbb{Q}] \leq \deg_{\mathbb{Q}}(\sqrt[5]{81}) \cdot \deg_{\mathbb{Q}}(\sqrt[81]{5}) = 5 \cdot 81 \quad (49)$$

Also, since  $[\mathbb{Q}(\sqrt[5]{81}) : \mathbb{Q}] = 5$  and  $[\mathbb{Q}(\sqrt[81]{5}) : \mathbb{Q}] = 81$  divide  $[\mathbb{Q}(\sqrt[5]{81}, \sqrt[81]{5}) : \mathbb{Q}]$  by Tower law,  $[\mathbb{Q}(\sqrt[5]{81}, \sqrt[81]{5}) : \mathbb{Q}]$  is a multiple of  $5 \cdot 81$  so its exactly  $5 \cdot 81$ .

Use tower law again,

$$5 \cdot 81 = [\mathbb{Q}(\sqrt[5]{81}, \sqrt[81]{5}) : \mathbb{Q}(\sqrt[81]{5})] \cdot [\mathbb{Q}(\sqrt[81]{5}) : \mathbb{Q}] \quad (50)$$

$$= 5 \cdot 81 \quad (51)$$

Thus,  $\sqrt[5]{81}$  is degree 5 over  $\mathbb{Q}(\sqrt[81]{5})$ . And we are done.
