## Q 1

**Question 1.** Let  $H \leq G$  such that  $|G : H| = 4$ . Prove: if  $g \in G$  and  $g$  has order 19, then  $g \in H$ .

Let  $G$  act on  $\{Hb\} = \mathcal{R}$ , the set of right cosets by right action. We have homomorphism

$$\begin{aligned}\rho : G &\mapsto \text{Sym}(\mathcal{R}) \cong S_4 \quad \text{since there are 4 cosets of } H. \\ g &\mapsto g^\rho, \\ g^\rho : \mathcal{R} &\mapsto \mathcal{R} \\ Hb &\mapsto Hbg\end{aligned}$$

Let  $g \in G$ , and  $|g| = 19$ . Want to show  $g \in H$ . Since  $\rho(g)$  is in  $\text{Sym}(\mathcal{R}) \cong S_4$ ,  $|\rho(g)|$  divide  $4!$ , which is the order of  $S_4$ . Also,  $|\rho(g)|$  divide  $|g| = 19$  since  $\rho$  is homomorphism, so  $|\rho(g)|$  divide  $\gcd(24, 19) = 1$ , so  $\rho(g) = id$ . So  $g$  is mapped to the identity permutation on the right cosets of  $H$ . Thus,

$$g \in \ker \rho = \bigcap_{g \in G} g^{-1}Hg \leq H.$$

## Q 2

**Question 2.** let a (finite) group  $G$  act on  $\Omega$  and on  $\Delta$ . the action on  $\Omega$  is transitive, and  $|\Omega| = 22$ ,  $|\Delta| = 10$ . Prove that the action of  $G$  on  $\Delta$  is not faithful. (i.e. the kernel of the action on  $\Delta$  is non-trivial)

Use O-S,  $G$  act on  $\Omega$ , for  $x \in \Omega$ ,  $|\mathcal{O}(x)| = 22$ ,

$$|\mathcal{O}(x)| \cdot |\text{stab}(x)| = |G| \implies 22 \mid |G|$$

Let  $\rho$  be denote the homomorphism associated with the group action.

$$\begin{aligned}\rho : G &\mapsto \text{Sym}(\Delta) \cong S_{10} \\ g &\mapsto g^\rho\end{aligned}$$

We have

$$\begin{aligned}G / \ker \rho &\cong \text{Im } \rho \leq \text{Sym}(\Delta) \\ |\text{Im } \rho| &\text{ divide } |G| = 22k \\ |\text{Im } \rho| &\text{ divide } 10!\end{aligned}$$

If  $G$  has finite order, then assume for contradiction  $|\ker \rho| = 1$ , then  $|G| = |\operatorname{Im} \rho|$  divide  $10!$ , but  $|G|$  has a factor of 11. Contradiction. So  $\ker \rho > 1$ .

If  $G$  has infinite order, then since  $|\operatorname{Im} \rho| \leq 10! < \infty$ ,  $|\ker \rho|$  must be infinite.

### Q 3

**Question 3.** Let  $\mathbb{C}^\times$  denote the multiplicative group of all non-zero complex numbers (under the ordinary multiplication). Prove that  $\mathbb{C}^\times$  does not have any non-trivial subgroup of finite index.

Supp that  $H$  has finite index in  $\mathbb{C}^\times$  and  $m = [\mathbb{C}^\times : H]$ . Then for any nonzero complex number  $z^m \in H$ , we have

$$z^m H = (zH)^m = H, \implies z^m \in H.$$

For all  $w \in \mathbb{C}$ , we can solve  $z^m - w = 0$  to write  $w$  as  $z^m$  for some  $z$ , hence  $w \in H$ , so  $\mathbb{C} \subseteq H$ , so  $H = \mathbb{C}$ .

### Q 4

**Proposition 1.** Let a group  $G$  have order  $2^2 \cdot 5 \cdot 17$ . Show that

1.  $G$  has a unique Sylow 5-subgroup and a unique Sylow 17-subgroup.
2.  $\exists$  an element of order  $85 = 5 \cdot 17$  in  $G$ .

**Soln 1:**  $|G| = 2^2 \cdot 5 \cdot 17$ . Let  $n_5 = \#$  of Sylow 5 subgroup. By Sylow's theorem, we have:

$$n_5 \equiv 1 \pmod{5} \tag{1}$$

$$n_5 \mid 2^2 \cdot 17 \tag{2}$$

hence,  $n_5$  can be 1, 2, 4, 17, 34,  $4 \cdot 17 = 68$ . Only  $1 \equiv 1 \pmod{5}$  among them. Thus,  $n_5 = 1$ , so Sylow 5 subgroup is unique.

Let  $n_{17} = \#$  of Sylow 17 subgroup. We have

$$n_{17} \equiv 1 \pmod{17} \tag{3}$$

$$n_{17} \mid 2 \cdot 2 \cdot 5 \tag{4}$$

Thus,  $n_{17}$  can be 1, 2, 5, 4, 10, 20, and only 1 satisfy

$$n_{17} \equiv 1 \pmod{17} \tag{5}$$

among them. So  $n_{17} = 1$ , and the Sylow 17 subgroup is unique.

**Soln 2:** Since there exists unique Sylow 5 subgroup  $=: H$  and there exists unique Sylow 17 subgroup  $=: N$ . We know that  $H \triangleleft G$ ,  $N \triangleleft G$ , so we know that  $H \cdot N$  is a

group (as long as one of  $H$  or  $N$  is normal).

$$H \cdot N \leq G$$

$$|H| = 5$$

$$|N| = 17$$

Thus, since there are of prime order, they are cyclic.

$$\exists h \in H, |h| = 5$$

(take the generator for example.)

$$\exists n \in N, |n| = 17.$$

Also,  $H \cap N = \{1\}$ , since for cyclic group of prime order, every element  $\neq 1$  has same order, so if  $1 \neq x \in H \cap N$ , then  $x \in H$ ,  $x$  has order 5, but  $x \in N$  implies  $|x|$  divide  $N = 17$ , but  $|x| = 5 \nmid 17$ .

$H \cdot N$  is the internal direct product of  $H$  and  $N$ ,

$$H \cdot N \cong H \times N \cong \mathbb{Z}_5^+ \times \mathbb{Z}_{17}^+ \cong \mathbb{Z}_{5 \cdot 17}^+ = \mathbb{Z}_{85}^+ \quad (6)$$

Since 5 and 17 are coprime, so  $\exists$  an element  $x \in H \cdot N$  of order 85, since Isomorphism preserve the order, so  $x \in H \cdot N \leq G$  implies  $x \in G$ , and  $x$  has order 85.

## Q 5

**Proposition 2.** Let  $Z \trianglelefteq G$  such that  $|Z| = 2$  and  $|G : Z| = 97$ . Show that

$$1. Z \leq Z(G)$$

$$2. G \text{ is cyclic.}$$

**soln to 1:**

$Z \triangleleft G$  and  $|Z| = 2$ . 97 is prime.  $G$  act on  $Z$  by conjugation.

$$G \xrightarrow{\rho} \text{Aut}(Z) \quad (7)$$

$$g \mapsto g^\rho \quad (8)$$

$g^\rho \in \text{Aut}(Z)$  so  $g^\rho : Z \rightarrow Z$  is isomorphism from  $Z$  to  $Z$ ,

$$g^\rho : Z \rightarrow Z \quad (9)$$

$$z \rightarrow g^{-1}zg \in Z, \quad (10)$$

since  $Z \triangleleft G$ . Recall that ( $g$  in the center of  $G$ )  $g \in Z(G) \iff g^\rho$  is trivial  $\iff g^\rho = id$ .  
WTS:  $x^\rho = id \forall x \in G$

We have

$$x^\rho \in \text{Imp} \leq \text{Aut}(Z) \quad (11)$$

$$|\text{Aut}(z)| = 1 \text{ since } |z| = 2 \quad (12)$$

Thus,  $|x^\rho|$  divides  $|Aut(z)| = 1$ .

This implies that  $x^\rho = id$ , and any  $x \rightarrow x^\rho : x^{-1}zx = z$  for  $z \in Z$ .

$1 \in Z(G)$  automatically, so  $Z \subset Z(G)$ .

**soln to 2 (not complete):**

We have  $Z \triangleleft G$  and  $|G/Z| = 97$ . Since  $|Z| = 2$  is prime,  $Z$  is cyclic.

$G/Z$  is cyclic?  $G$  abelian? See HW01.

$$G \xrightarrow{\eta} G/Z \tag{13}$$

$$g \mapsto gz \tag{14}$$

Consider the following map?

$$f : G \rightarrow Z \subset Z(G) \tag{15}$$

$$g \rightarrow g^{97} \tag{16}$$

so we have

$$Zg^{97} = (Zg)^{97} = Z, \implies g^{97} \in Z. \tag{17}$$

Do we have

$$G \cong \mathbb{Z}_2 \otimes \mathbb{Z}_{97} \cong \mathbb{Z}_{194}? \tag{18}$$
