Suppose that  $\gamma$  is an algebraic integer and n is a positive integer. Prove that  $\sqrt[n]{\gamma}$  is an algebraic integer. Solution:

Since  $\gamma$  is an algebraic integer,  $\exists$  monic  $f(x) \neq 0$ , and  $f(x) \in \mathbb{Z}[x]$  such that  $f(\gamma) = 0$ . Let

$$f = X^m + a_{m-1}X^{m-1} + \dots + a_1X + a_0 \tag{1}$$

Consider

$$g = X^{mn} + a_{m-1}X^{n(m-1)} + a_{m-2}X^{n(m-2)} + a_1X^n + a_0,$$
(2)

we see that  $\sqrt[n]{\gamma}$  is clearly a root of g, since  $\gamma$  is a root of f. Now, g is monic,  $g \in \mathbb{Z}[x], g \neq 0$ , since  $f \neq 0$ .

Let  $\alpha$  be an algebraic number, i.e.,  $g(\alpha) = 0$  for some  $0 \neq g(x) \in \mathbb{Q}[x]$ . Show that  $\alpha = \frac{\beta}{n}$  with some algebraic integer  $\beta$  and positive integer n.

#### Solution:

Let  $\alpha$  be an algebraic number. Thus  $\exists 0 \neq g(x) \in \mathbb{Q}[x]$  such that  $g(\alpha) = 0$ . g is not necessary in  $\mathbb{Z}[x]$ , but we can multiply by the least common multiple of the denominators of all the rational coefficients to obtain g' such that

$$0 = g'(\alpha) = a_n \alpha^n + a_{n-1} \alpha^{n-1} + \dots + a_1 \alpha + a_0.$$
(3)

such that  $a_i \in \mathbb{Z} \forall i$ . Now we claim that  $\beta = a_n \cdot \alpha$  is algebraic integer. First, we multiply both sides of equation 3 by  $a_n^{n-1}$ .

$$0 = a_n^n \alpha^n + a_{n-1} a_n^{n-1} \alpha^{n-1} + a_{n-2} a_n^{n-1} \alpha^{n-2} + \dots + a_1 a_n^{n-1} \alpha + a_0 a_n^{n-1}.$$

$$(4)$$

Let  $X = a_n \cdot \alpha$ , Then

$$X^{n} + a_{n-1}X^{n-1} + \ldots + a_{1}a_{n}^{n-2}X + a_{0}a_{n}^{n-1}$$

$$\tag{5}$$

is a monic polynomial with coefficient in  $\mathbb{Z}$ , such that  $\beta$  is a root. And this polynomial is non-zero since polynomial g' we started with is non-zero. Hence,  $\alpha = \frac{\beta}{a_n}$  as wanted.

Proof.
